

VPS Database Fix Instructions

For mshauri.marichomedia.com on 64.247.178.45

Visit Maricho Media

Main website: <https://marichomedia.com/>

What this fixes

The deployment stopped at drizzle-kit push with ERR_PNPM_RECURSIVE_RUN_FIRST_FAIL. The updated deployment scripts now repair an existing PostgreSQL role, database ownership, schema permissions, and login credentials before running Drizzle.

1. Pull the repaired deployment scripts

Log in to the VPS and run these commands exactly:

```
cd /var/www/mshauri
git pull --ff-only origin main
bash deploy/2-setup-app.sh
```

2. Keep the environment settings correct

Use the existing file:

```
/var/www/mshauri/deploy/.env.production
```

It must contain valid values for DB_NAME, DB_USER, DB_PASS, and SESSION_SECRET.

Do not manually add DATABASE_URL. The repaired scripts generate it automatically from the database settings. This avoids password encoding errors.

3. Confirm the database repair completed

Before the schema push, the terminal should show:

```
Reconciling PostgreSQL role and database...
Checking the application database login...
■ PostgreSQL login and schema permissions verified.
```

After that, the script will build the application, push the schema, install the Nginx configuration, and start the API with PM2.

4. Run the final checks

```
pm2 status
curl -f http://127.0.0.1:8080/api/healthz
sudo nginx -t
```

Expected results:

- PM2 shows mshauri-api as online.
- The health check returns a successful response, normally JSON containing a healthy/ok status.
- Nginx reports: syntax is ok and test is successful.

5. Enable HTTPS

Only run this after DNS points mshauri.marichomedia.com to 64.247.178.45:

```
sudo certbot --nginx -d mshauri.marichomedia.com
sudo certbot renew --dry-run
```

Important

The setup script is safe to rerun. Do not manually delete the database or PostgreSQL user. If the script reports a missing or invalid setting, correct only that setting in `deploy/.env.production` and run the same command again.
